

4 Days AI

En dag mer frihet. Med AI.

MAC QUICK START

Your Own AI Agent

Hermes for Complete Beginners
One calm step at a time

In this six-page guide, you will:

- prepare your Mac and install Hermes;
- recover if the first installation does not finish;
- connect an AI provider;
- send your first real message.

Keep private: passwords, API keys, tokens, login codes and payment details.

4 Days AI AB

Version 1.1 · Last checked 25 July 2026

Customer guide · Official Hermes source: hermes-agent.nousresearch.com/docs

Prepare your Mac first

Hermes needs a standard tool called **Git**. You do not need to learn Git or programming—we only need to confirm that your Mac has it.

1. Press **Command ⌘ + Space**. Type **Terminal**, then open **Terminal**.
2. Click inside the Terminal window, type the command below, then press **Return** once.

```
git --version
```

If a version appears: Your Mac is ready. Close Terminal and continue.

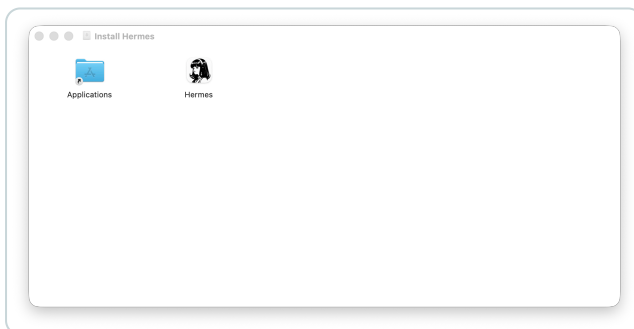

If macOS offers developer tools: Click **Install**, wait until it finishes, then run `git --version` again.

If no installation window appears and Git is unavailable, type this in Terminal and press **Return**:

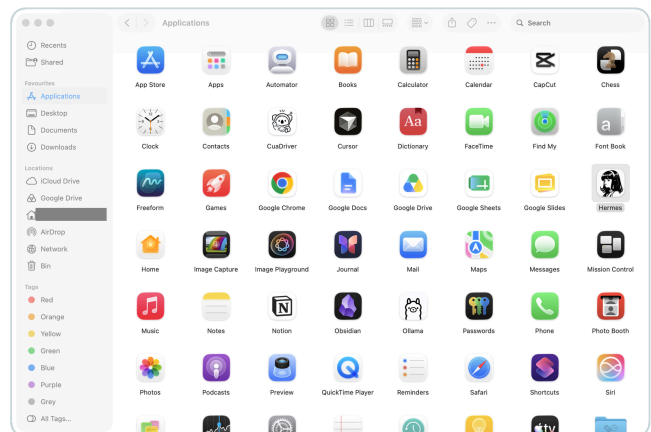

```
xcode-select --install
```

Download Hermes

1. Open Safari and visit **hermes-agent.nousresearch.com**.
2. Choose the Mac download and open **Hermes-Setup.dmg**.
3. Drag **Hermes** onto **Applications**, then open Hermes from Applications.

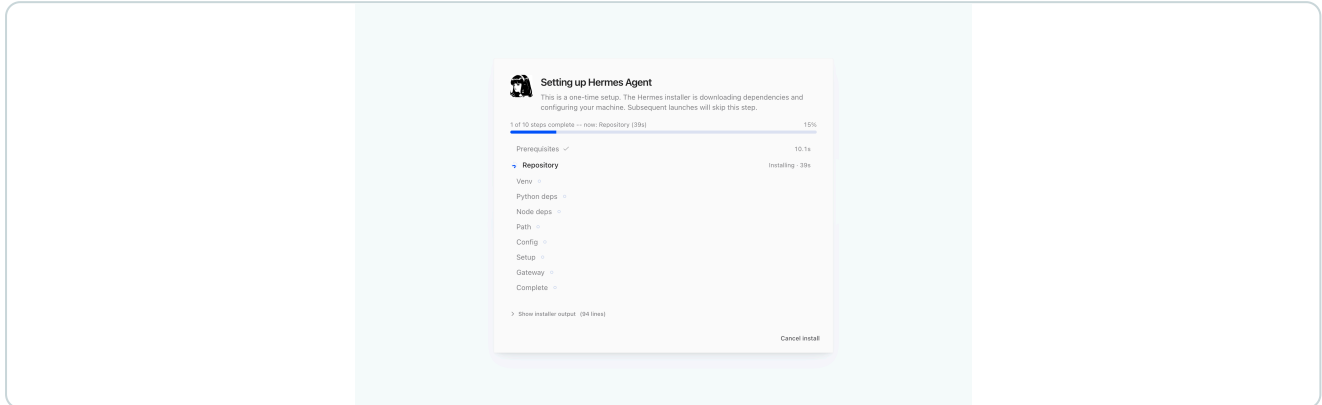

Look for: Install Hermes, Hermes and Applications.

Then: Open Applications and double-click Hermes.

Wait for a clear result

Keep Hermes open and keep your Mac connected to the internet while the one-time setup runs.

Wait here: “Setting up Hermes Agent.” The percentage and step name will change.

HERMES IS READY

Click **Launch Hermes**, then continue to page 4.

INSTALL DIDN'T FINISH

Do not give up. Follow the rescue steps below.

READ THE REST OF THIS PAGE ONLY IF THE INSTALLATION DID NOT FINISH.

You have not broken anything. Your Mac may simply be missing Apple’s Command Line Tools. These are standard Apple components; you do not need to learn programming.

1. Click **Open log folder**.
2. Open `bootstrap-installer.log` and go to the very end.
3. If you see `stage=prerequisites, Could not install Git automatically, or xcode-select --install`, open Terminal with **Command ⌘ + Space → Terminal**.
4. Type the command below and press **Return**:

```
xcode-select --install
```

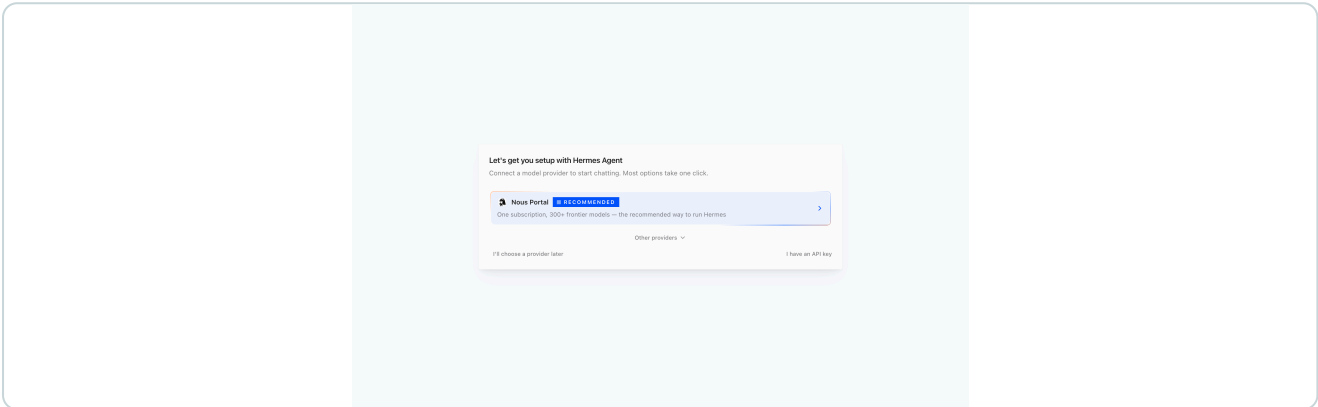

5. Complete the Apple installation. Then run `git --version`. A version number confirms Git is ready.
6. Return to Hermes and click **Retry install**.
7. Wait for **HERMES IS READY**, then click **Launch Hermes**.

Do not: download Hermes repeatedly, delete files at random, or enter commands from an unfamiliar website. Install the Apple tools, verify Git, then retry once.

Give Hermes an AI model

Keep the services separate: Hermes is the agent installed on your Mac. ChatGPT and Grok are AI services. Grok can be used on grok.com without installing an app, but that browser use does not automatically connect Grok to Hermes.

Hermes needs a provider before it can answer. The setup screen shows **Nous Portal** as **RECOMMENDED**.

Choose deliberately: Nous Portal, another provider, or an account you already use.

Two different codes can appear

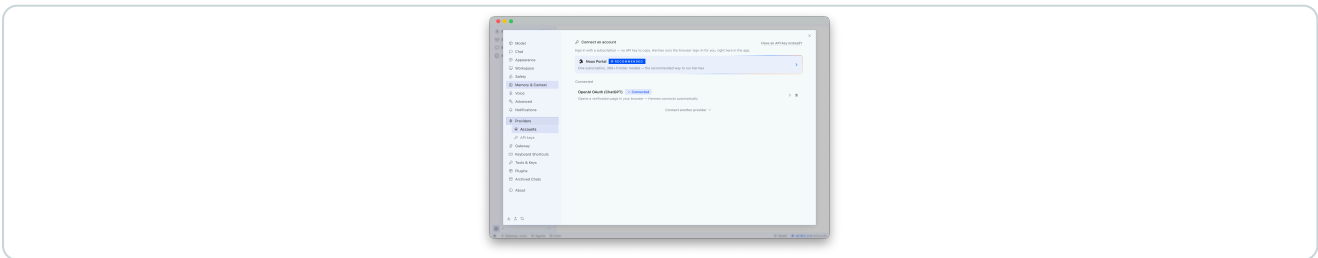

This is normal. The codes are not supposed to match.

Code	Example	Where it goes
E-mail confirmation code	726805	Enter confirmation code in the portal
Hermes device code	FSEF-TPPZ	The authorize/device page

If the verification page disappears: Return to Hermes and choose **Re-open verification page**. Also check your other browser windows. Never share either code.

Cost boundary: Hermes is open-source, but provider access and limits vary. A plan shown as \$0 may still request a payment method. Read the live price, renewal and payment terms before continuing.

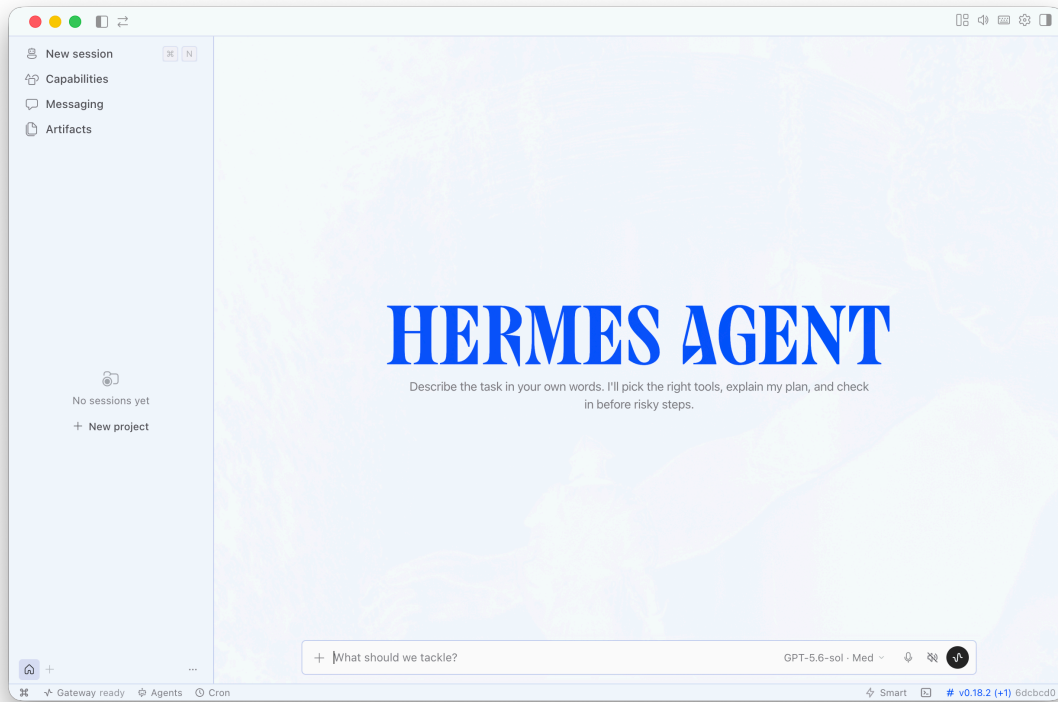

After sign-in, open **Settings** → **Providers** → **Accounts**. Your chosen provider should show **Connected**.

Example: OpenAI OAuth (ChatGPT) – Connected. Your provider name may differ.

Send one real message

Close Settings with the **X**. In the main chat, look near the bottom for the writing area and a model name.

Look for: New session, the writing area, a model name and Gateway ready.

1. Click inside the writing area.
2. Type or copy this message:

Hello. Please introduce yourself in two short sentences and tell me three things you can help me with.

3. Use the round control on the right to send it.
4. Wait until a complete answer appears.

Milestone: A real answer means the installation, provider and model are working together. Your first conversation is a genuine achievement.

If something looks different

Do not try ten fixes. Make one check, look at the result, then continue.

Calm rescue order

1. Read or photograph the exact non-secret message on the screen.
2. For **INSTALL DIDN'T FINISH**, use the Mac rescue steps on page 3.
3. Check that Safari can open [the official Hermes documentation](#).
4. Close Hermes with **Command-Q**, then reopen it from **Applications**.
5. Check **Settings** → **Providers** → **Accounts** for **Connected**.
6. Check that a model name appears near the writing area.

Optional health check

If the simple checks do not help, open Terminal and run:

```
hermes doctor
```

This diagnoses setup problems. It does not automatically apply repairs. Do not run `hermes doctor --fix` until you understand the diagnosis.

Your completion check

- | | |
|---|---|
| ☐ Git shows a version | ☐ Hermes opens |
| ☐ A provider shows Connected | ☐ A model is selected |
| ☐ A real answer appears | ☐ No private code was shared |

Current help: hermes-agent.nousresearch.com/docs

Hermes changes over time. If a future screen differs, trust the current official documentation rather than clicking where an older picture suggests.

You did it: You installed Hermes, cleared any first hurdle, connected an AI model and began your first conversation. ✨
